SUMMARY

Working in preventive cybersecurity at the Legislative Assembly of Goiás (ALEGO, Brazil), handling email threat triage and security awareness for a parliamentary office. Builds open-source application security and phishing analysis tools in PHP and Python, with OWASP Top 10 mitigations and documentation in English, Spanish and Portuguese. Public sector experience since 2017, handling confidential records under LGPD (Brazil's data protection law). Pursuing a Technologist Degree in Cybersecurity at Anhembi Morumbi University (expected 2028).

TECHNICAL SKILLS

- **Security & Threats:** Phishing Analysis, E-mail Authentication (SPF, DKIM, DMARC), IoC Extraction, Threat Intel (VirusTotal API), Social Engineering Awareness, OPSEC, OWASP Top 10.
- **Application Security:** XSS, CSRF, Session Fixation, Broken Access Control, brute-force protection, Content-Security-Policy and security headers, password hashing (bcrypt).
- **Development:** Python (automation, REST APIs), PHP (secure coding), SQL, Regex, Bash.
- **Systems:** Linux (Apache/LAMP), Networking Fundamentals.
- **Tools:** Git, GitHub, Claude Code (AI-assisted development).

PROFESSIONAL EXPERIENCE

Legislative Assembly of Goiás (ALEGO) – Parliamentary Office Goiânia, Brazil
Executive Secretary | Preventive Cybersecurity 07/2026 – Present

- Shared email threat triage in a two-person office security function, reviewing 60+ suspicious emails per month (sender domains, headers, embedded links) and confirming 73 phishing attempts since July 2026, with no credentials compromised.
- Delivered security awareness guidance to 10 staff on phishing, password hygiene and safe use of corporate systems.

Earlier public sector roles (2017–2026): DETRAN-GO, ALEGO and the State Court of Justice (TJGO) – Administrative Assistant: verified identity and legal documents in state systems and handled confidential records under strict procedures and LGPD.

CYBERSECURITY PROJECTS (GITHUB)

1. Secure Auth & Session Management System (PHP) github.com/MattheusAlfonso/secure-auth-system

- bcrypt-hashed login with server-side brute-force lockout (5 attempts → 15 min) and timing-safe username checks.
- Session Fixation and hijacking defenses: session_regenerate_id(), HttpOnly/SameSite cookies, strict mode, idle and absolute timeouts.
- Centralized access control (OWASP A01), CSRF tokens on login/logout and security headers (Content-Security-Policy, X-Frame-Options).

2. PyThreatIntel – Phishing & Threat Intel Analyzer (Python) github.com/MattheusAlfonso/pythreatintel

- Command-line tool that analyzes .eml files: validates SPF/DKIM/DMARC, traces the origin IP through the Received chain and detects spoofing (From × Return-Path × Reply-To).
- Extracts IoCs (URLs and attachment SHA256 hashes), checks IP reputation via the VirusTotal API and produces a risk score with JSON output for SIEM pipelines.

3. Secure Input Validation & Output Encoding (PHP) github.com/MattheusAlfonso/01-input-validation-security

- Allowlist input validation and output encoding against XSS (blocks javascript:/data: URLs), CSRF protection and a strict Content-Security-Policy.

EDUCATION & LANGUAGES

- **Technologist Degree in Cybersecurity** — Anhembi Morumbi University | 2026–2028 (expected)
- **Portuguese:** Native — **English:** Advanced / Technical — **Spanish:** Intermediate
