OBJECTIVE

Junior Cybersecurity Analyst / Application Security

PROFESSIONAL SUMMARY

Information Security professional with hands-on experience at the Legislative Assembly of Goiás (ALEGO, Brazil), focused on the preventive layer: security awareness, digital hygiene, OPSEC and Social Engineering (Phishing) prevention. Builds security projects in PHP and Python with OWASP Top 10 mitigations, documented in English, Spanish and Portuguese. Uses AI (Claude Code) for security code review, testing and documentation, validating every change. Currently studying Information Security, with expected graduation in 2027.

TECHNICAL SKILLS

- **Information Security & Threats:** Phishing Analysis, Social Engineering Awareness, Digital Hygiene, OPSEC, E-mail Authentication (SPF, DKIM, DMARC), IoC Extraction, Threat Intel (VirusTotal API), OWASP Top 10.
- **Application Security:** XSS, CSRF, Session Fixation, Broken Access Control, brute-force protection, Content-Security-Policy and security headers, password hashing (bcrypt).
- **Development:** PHP (Secure Coding), Python (automation, REST APIs), HTML5, CSS3, Regex Parsing, SQL, Java.
- **Systems & Infrastructure:** Linux (Apache/LAMP, Bash), Windows Server, Networking Fundamentals.
- **Tools:** Git, GitHub, VS Code, curl, Claude Code (AI-assisted development).

PROFESSIONAL EXPERIENCE

Legislative Assembly of Goiás (ALEGO) – Parliamentary Office Goiânia, Brazil
Technology & Preventive Cybersecurity Analyst 01/2024 – Present

- Front-line preventive cybersecurity: guiding the team on digital hygiene, safe use of systems and social engineering prevention.
- Triage and identification of phishing attempts and suspicious e-mails received by the office.
- Promoting information security and OPSEC best practices, protecting data integrity and the institution's reputation.

CYBERSECURITY PROJECTS (GITHUB)

1. Secure Authentication & Session Management System (PHP) Repository

- bcrypt-hashed login with server-side brute-force lockout (5 attempts → 15 min) and timing-safe username checks.
- Session Fixation and hijacking defenses: session_regenerate_id(), HttpOnly/SameSite cookies, strict mode, idle and absolute timeouts.
- Centralized access control (OWASP A01), CSRF tokens on login/logout and security headers (CSP, X-Frame-Options).

2. PyThreatIntel – Phishing & Threat Intel Analyzer (Python) Repository

- Command-line tool that analyzes .eml files: validates SPF/DKIM/DMARC, traces the origin IP through the Received chain and detects spoofing (From × Return-Path × Reply-To).
- Extracts IoCs (URLs and attachment SHA256 hashes), checks IP reputation via the VirusTotal API and produces a risk score with JSON output for SIEM pipelines.

3. Phishing & Email Header Analyzer (PHP) Repository

- Web app for e-mail header triage: extracts IoCs, reads SPF/DKIM/DMARC from the trusted Authentication-Results header and produces an explainable risk score (spoofing and BEC).

4. Secure Input Validation & Output Encoding (PHP) Repository

- Allowlist input validation and output encoding against XSS (blocks javascript:/data: URLs), CSRF protection and a strict Content-Security-Policy.

EDUCATION & LANGUAGES

- **Information Security (Cybersecurity)** – In progress – expected graduation in 2027
- **Portuguese:** Native — **English:** Advanced / Technical — **Spanish:** Intermediate
